SANYAM JHA

New Delhi, New Delhi, India sanyamjha420@gmail.com +918383893679

SUMMARY

Data Analysis enthusiast with hands-on experience in Python, SQL, and Power BI, having completed EDA projects on real-world datasets. B.Sc. (Hons) Physics graduate-in-progress with a strong quantitative grounding in statistics, mathematical modeling, and analytical reasoning. Seeking a role in data analytics and engineering to build scalable data pipelines and deliver business insights.

PROJECTS

Customer 360° E-Commerce Analytics Warehouse

MySQL • github.com/sanyam410/customer-360-ecommerce-analytics

- Generated a synthetic e-commerce dataset (250 customers, 1,500+ orders, 2,600+ line items) with Python, then built a 4-layer MySQL warehouse (staging → warehouse → analytics → presentation).
- Modeled a Star Schema (1 fact table, 4 dimension tables), filtering to delivered orders only to keep revenue metrics business-accurate.
- Computed CLV, Recency, Frequency, and Monetary metrics via SQL aggregations, then applied NTILE(4) window functions to quartile-rank customers into Champions, Loyal, At Risk, and Lost segments.
- Built a rule-based churn flag (90-day inactivity) into a unified presentation-layer view for retention targeting.

Does Money Buy Movie Success? — IMDb EDA (1980–2020)

Python, Pandas • github.com/sanyam410/IMDB-1980-2020-Analysis

- Analyzed 7,668 films to test whether production budget predicts IMDb score vs.
- box-office revenue, finding budget strongly predicts gross but is nearly uncorrelated with quality.
- Engineered features (ROI, Profit, Buzz Score, Decade/Budget bins) and cleaned inconsistent fields; re-deriving country from release data and standardizing TV/film rating scales.
- Found 32.2% of the 5,436 films with known budget/gross failed to break even, and quantified genre-level efficiency (Horror: ~76x avg ROI vs.
- Animation: lowest score-per-dollar).

Plot-Based Movie Recommender

Python, Sentence Transformers, OMDb API • github.com/sanyam410/Movie-recommender/tree/main

- Built a content-based recommender across a 7,668-film IMDb dataset (1980–2020), enriching incomplete metadata with full plot, cast, and multi-genre information to recommend movies by story similarity rather than just shared credits.
- Designed a resumable OMDb enrichment pipeline around the free-tier limit of ~950 API requests/day, enabling reliable multi-day data collection without losing progress.
- Improved dataset quality through 4 validation checks—fuzzy title matching, ±1-year release-date tolerance, non-movie filtering, and metadata consistency checks—projected to exclude ~57 invalid records across 7,668 films, based on a 0.7% rejection rate observed in the first 1,870 API-enriched records.
- Generated 384-dimensional plot embeddings using all-MiniLM-L6-v2 and used cosine similarity for near-instant ranking; added a 5-level fallback flow (local match → OMDb → Wikipedia → pasted synopsis → user plot) to handle movies outside the local dataset.

EDUCATION

B.Sc. (Hons) Physics

Acharya Narendra Dev College, University of Delhi

Class XII (Science)

Govt. SBV No. 1, Delhi • 2024

- 84%.

SKILLS

Programming Languages: Python, R

Database & Querying: MySQL (Joins, Aggregations, Window Functions), Data Warehousing, Star Schema Modeling

Data Analytics: ETL, RFM Segmentation, Customer Behavior Analysis, OLAP Modeling

Visualization Tools: Power BI

Productivity Tools: MS Excel, MS Word, PowerPoint
